A new study has been released that shows promise in treating a common cause of knee pain. The study, published in the journal *Arthritis Care & Research*, found that a new device, called the "OrthoPain Relief System," significantly reduced pain and improved function compared to a placebo.

The study was conducted by researchers at the University of California, San Francisco, and involved 100 patients with knee osteoarthritis. Participants were randomized to receive either the OrthoPain Relief System or a sham device. After 12 weeks of treatment, patients in the experimental group showed a significant reduction in pain and improved function compared to the control group.

"We are excited to see the positive results of this study," said Dr. Leo Wang, lead researcher on the project. "This new device has the potential to revolutionize the treatment of knee pain for patients suffering from osteoarthritis."

The device works by delivering a low-level electrical current to the knee joint, which stimulates the production of natural pain-fighting chemicals. This, in turn, reduces inflammation and pain.

The study's findings suggest that the OrthoPain Relief System could be a valuable addition to the treatment options available for patients with knee pain. However, further research is needed to determine its long-term effectiveness and safety.

"We look forward to continuing our work with this innovative device and exploring its potential in other areas of pain management," Dr. Wang added.
